

John's History

PSA = 9.2 in 2017. Gleason = 8. I did 5 weeks of radiation therapy, followed by 54 radioactive seed implants and single Lupron injection. Negative PSMA-PET scan in 2022. PSA rose back to 9 in 2023. New MO at Mayo Phoenix started bicalutamide. PSA dropped to 1.6 in July, 2023, but then increased to 9.7 in Dec, 2023. Second PSMA-PET scan showed 5 bone mets in pelvis, spine, and collarbone. I started quarterly Lupron shots and began Erleada™ (apalutamide) doublet therapy in Jan, 2024. PSA reduced to 1.8 by Feb, 2024, and held steady at 0.8. By summer, 2025, doublet therapy began to fail. PSA rose to 2.8. Third PSMA-PET scan showed one new bone met and one hot lymph gland. FDG scan showed no other cancer. Started Pluvicto™ PSMA-theranostic treatment (Lutecium-177) Jan. 2026. PSA = 5.8. Did four rounds of Pluvicto™ and PSA dropped to 0.5. Started Provenge™ immunotherapy in 2026. Waiting to do 2 more rounds of Pluvicto™ treatment.
